

environmental and natural resource economics

Environmental and Natural Resource Economics: Understanding the Balance Between Growth and Sustainability

Environmental and natural resource economics is a fascinating and increasingly vital field that explores the intricate relationship between economic growth and the sustainable management of our planet's resources. As the world grapples with challenges like climate change, biodiversity loss, and resource depletion, understanding how economies interact with the environment becomes crucial. This branch of economics helps us analyze how natural resources are used, conserved, and valued, providing tools and insights to make better policy decisions that can lead to a more sustainable future.

What Is Environmental and Natural Resource Economics?

At its core, environmental and natural resource economics examines how economic activities impact the environment and how natural resources can be managed efficiently. Unlike traditional economics, which often overlooks the environmental costs of production and consumption, this field integrates ecological considerations into economic analysis. It seeks to address questions such as: How can we price pollution? What is the true cost of depleting forests or fisheries? How do we balance economic development with conservation goals?

This discipline involves evaluating externalities (unintended side effects like pollution), public goods (such as clean air and biodiversity), and common-pool resources (like groundwater and fisheries). It also studies how market mechanisms, regulations, and policies can be designed to protect the environment without stifling economic progress.

The Importance of Valuing Natural Resources

One of the biggest challenges in environmental and natural resource economics is assigning a monetary value to resources that don't have a clear market price. For example, how do you value clean air, a scenic landscape, or the ecosystem services provided by wetlands? Without proper valuation, these resources are often undervalued or ignored, leading to overexploitation and degradation.

Methods of Valuation

Economists have developed several techniques to estimate the value of natural resources and environmental benefits, including:

- **Contingent Valuation:** Surveys ask people their willingness to pay for environmental improvements or their willingness to accept compensation for degradation.
- **Hedonic Pricing:** This method looks at how environmental factors affect market prices, such as how proximity to clean parks increases property values.
- **Travel Cost Method:** Used to estimate the value of recreational sites by analyzing how much people spend to visit them.
- **Benefit Transfer:** Applying valuation estimates from one context or location to another when direct studies are not feasible.

Understanding these values helps policymakers design incentives, taxes, or subsidies that reflect the real costs and benefits of environmental actions.

Managing Renewable and Non-Renewable Resources

Environmental and natural resource economics differentiates between renewable resources such as forests, fish stocks, and clean water, and non-renewable resources like oil, coal, and minerals. Each type requires different management approaches to ensure long-term sustainability.

Renewable Resources

With renewable resources, the focus is often on maintaining a sustainable yield—using the resource at a rate that allows it to replenish naturally. For instance, fisheries management aims to prevent overfishing by setting quotas based on scientific assessments of fish populations. Similarly, forestry economics studies how to harvest timber without compromising the forest's health and biodiversity.

Non-Renewable Resources

Non-renewable resources pose a different challenge since they cannot be replaced once extracted. Environmental and natural resource economics explores how to allocate these finite resources over time optimally. The Hotelling Rule, for example, suggests that resource owners should increase prices at a rate reflecting the opportunity cost of depleting the resource now versus in the future. This encourages conservation and investment in alternatives.

Addressing Environmental Externalities

A key focus of environmental and natural resource economics is dealing with externalities—costs or benefits from economic activities that affect third parties and are not reflected in market prices.

Pollution is a classic negative externality, where factories may discharge waste into rivers without paying for the environmental damage.

Market-Based Solutions

Economists advocate for market-based instruments that internalize these externalities, making polluters pay for the harm they cause. Some common approaches include:

- **Pigouvian Taxes:** Taxes imposed on activities that generate negative externalities, such as carbon taxes on greenhouse gas emissions.
- **Tradable Permits:** Cap-and-trade systems where companies buy and sell pollution allowances, incentivizing reductions where it's cheapest.
- **Subsidies for Clean Technology:** Financial incentives that encourage investment in renewable energy and pollution control.

These tools provide flexibility and economic incentives for businesses and individuals to reduce environmental harm efficiently.

The Role of Policy and Regulation

While market mechanisms are powerful, regulatory frameworks also play a critical role in environmental and natural resource economics. Governments establish environmental standards, protected areas, and conservation programs to safeguard ecosystems and public health.

Balancing Economic Growth and Environmental Protection

One of the ongoing debates in this field revolves around how to balance economic development with environmental sustainability. Developing countries, in particular, face the challenge of lifting people out of poverty while managing natural resources responsibly. Environmental economists emphasize the concept of sustainable development—meeting today's needs without compromising the ability of future generations to meet theirs.

Policies such as environmental impact assessments, green taxes, and investment in clean technologies help align economic incentives with environmental goals. International cooperation is also crucial, as environmental issues like climate change and biodiversity loss transcend national borders.

Emerging Trends and Challenges

Environmental and natural resource economics is evolving rapidly in response to new challenges and technologies. Climate change economics has become a major subfield, focusing on the costs of mitigation and adaptation. The economics of ecosystem services is gaining traction, highlighting the benefits nature provides beyond raw resources.

Another area of growth is behavioral environmental economics, which integrates insights from psychology to understand why people and firms may not always act in environmentally rational ways and how policies can be designed to nudge better choices.

Technology and Innovation

Advancements in technology, from renewable energy to precision agriculture, are reshaping how natural resources are used. Environmental economists analyze the economic impacts of these innovations and how policies can accelerate their adoption to reduce environmental footprints.

Why Understanding Environmental and Natural Resource Economics Matters to Everyone

Whether you're a policymaker, business leader, or concerned citizen, the principles of environmental and natural resource economics offer valuable perspectives on the trade-offs and decisions that shape our world. By appreciating the economic value of nature and the costs of environmental damage, we can make more informed choices that protect our planet while supporting prosperity.

In a world where resources are limited and environmental challenges loom large, this field provides the tools and knowledge to navigate a sustainable path forward—one that respects the delicate balance between human activity and the natural systems that sustain life.

Frequently Asked Questions

What is environmental and natural resource economics?

Environmental and natural resource economics is a subfield of economics that studies the economic impact of environmental policies and the management of natural resources, focusing on how to allocate scarce natural resources efficiently while minimizing environmental damage.

How do economists value natural resources and ecosystem services?

Economists use various valuation methods such as contingent valuation, hedonic pricing, and cost-benefit analysis to estimate the economic value of natural resources and ecosystem services, helping

inform policy decisions and resource management.

What role do market-based instruments play in environmental policy?

Market-based instruments like carbon taxes, tradable permits, and pollution charges incentivize firms and individuals to reduce environmental harm efficiently by incorporating environmental costs into market prices.

Why is sustainable resource management important in natural resource economics?

Sustainable resource management aims to balance economic development with the preservation of natural resources for future generations, preventing resource depletion and maintaining ecosystem health.

How does climate change impact environmental and natural resource economics?

Climate change introduces risks and uncertainties that affect resource availability, economic productivity, and ecosystem services, requiring economists to develop models and policies that address mitigation, adaptation, and resilience.

Additional Resources

Environmental and Natural Resource Economics: Navigating Sustainability and Economic Growth

environmental and natural resource economics is an interdisciplinary field that examines the complex relationship between economic activity and the environment. It seeks to understand how natural resources can be managed efficiently and sustainably while balancing the demands of economic development. As global environmental challenges such as climate change, biodiversity loss, and resource depletion intensify, this branch of economics has become crucial for policymakers, businesses, and researchers aiming to craft strategies that promote sustainability without compromising growth.

Understanding Environmental and Natural Resource Economics

At its core, environmental and natural resource economics explores how economic incentives and market mechanisms influence the use and conservation of natural resources. Unlike traditional economics, which often assumes unlimited resource availability, this discipline explicitly considers the finite nature of environmental assets like forests, water, minerals, and clean air. It addresses market failures arising from externalities—costs or benefits that affect third parties not directly involved in economic transactions, such as pollution or habitat destruction.

Key Concepts and Theoretical Foundations

One foundational concept in environmental economics is the idea of externalities. Negative externalities, such as carbon emissions, result in social costs that are not reflected in market prices. This leads to overconsumption or overexploitation of resources. Conversely, positive externalities, like reforestation, generate benefits beyond the immediate user. Internalizing these externalities through mechanisms such as taxes, subsidies, or tradable permits is central to achieving efficient resource allocation.

The notion of sustainable development also features prominently. It promotes meeting the needs of the present without compromising the ability of future generations to meet theirs. This principle challenges traditional growth models, encouraging economists to incorporate ecological constraints into policy design.

The Role of Market-Based Instruments

Market-based instruments (MBIs) have gained traction as effective tools in environmental and natural resource economics. By leveraging economic incentives, MBIs aim to correct market failures and encourage environmentally responsible behavior.

Carbon Pricing and Emissions Trading Systems

Carbon pricing, through mechanisms like carbon taxes or cap-and-trade programs, is among the most widely discussed MBIs. By assigning a cost to greenhouse gas emissions, these policies motivate firms and consumers to reduce their carbon footprint. For instance, the European Union's Emissions Trading System (EU ETS) is the world's largest carbon market, covering over 11,000 power stations and industrial plants. Since its inception in 2005, the EU ETS has contributed to a substantial decrease in emissions from covered sectors by incentivizing cleaner technologies and operational efficiencies.

The economic efficiency of carbon markets depends on setting appropriate price signals and ensuring robust monitoring and enforcement. Critics argue that if carbon prices are too low, they fail to drive meaningful change, while excessively high prices may burden industries and consumers.

Payments for Ecosystem Services

Payments for Ecosystem Services (PES) represent another innovative approach. PES schemes compensate landowners or resource users for managing their land in ways that provide ecological benefits, such as carbon sequestration, water purification, or biodiversity conservation. These programs aim to make conservation economically viable, especially in regions where resource exploitation is a primary income source.

Challenges in Valuing Natural Resources and Environmental Goods

A significant hurdle in environmental and natural resource economics lies in accurately valuing natural assets and ecosystem services. Many environmental goods, like clean air or scenic landscapes, are public goods—non-excludable and non-rivalrous—making them difficult to price through traditional markets.

Non-Market Valuation Techniques

To address this, economists employ various non-market valuation methods, including:

- **Contingent Valuation:** Surveys ask individuals their willingness to pay for specific environmental improvements or their willingness to accept compensation for environmental degradation.
- **Hedonic Pricing:** Analyzes how environmental factors affect market prices, such as property values influenced by air quality or proximity to green spaces.
- **Travel Cost Method:** Estimates the value of recreational sites by examining how much people spend to visit them.

While these techniques provide valuable insights, they are subject to biases and uncertainties, complicating policy decisions that rely on cost-benefit analyses.

Natural Resource Economics: Managing Finite Stocks

Natural resource economics focuses specifically on the extraction, use, and conservation of resources like minerals, forests, fisheries, and water. It addresses the trade-offs between current consumption and future availability.

Renewable vs. Nonrenewable Resources

The management strategies differ fundamentally between renewable and nonrenewable resources. Renewable resources, such as forests and fisheries, can replenish naturally if harvested sustainably. Overexploitation, however, can lead to resource collapse, as seen in several global fisheries. Nonrenewable resources, like oil and minerals, exist in finite quantities, leading to concerns about depletion and the need for substitution or technological innovation.

Optimal Extraction and the Hotelling Rule

The Hotelling rule provides a theoretical framework for the optimal extraction of nonrenewable resources. It suggests that resource owners should increase extraction rates as the resource becomes scarcer, reflecting rising prices over time. However, real-world factors such as technological change, market demand, and policy interventions often complicate this model.

Policy Implications and Future Directions

Environmental and natural resource economics inform a wide range of policy decisions, from climate change mitigation to conservation strategies. As environmental challenges grow more complex, economists emphasize integrated approaches that combine regulation, market incentives, and community-based management.

Balancing Economic Growth and Environmental Sustainability

One of the persistent debates in this field revolves around the compatibility of economic growth with environmental protection. While some argue that strict environmental regulations hinder growth, others advocate for a green economy model, where innovation and sustainable practices drive long-term prosperity. Empirical studies increasingly support the latter, showing that investment in clean technologies can generate jobs and improve public health.

Incorporating Climate Change Risks

Climate change adds another layer of complexity to environmental economics. The uncertainty and scale of climate impacts necessitate adaptive policies that account for risk and resilience. Concepts such as the social cost of carbon attempt to quantify the long-term economic damages caused by emissions, guiding investment and regulatory decisions.

Emerging Trends and Research Areas

The landscape of environmental and natural resource economics continues to evolve, fueled by technological advancements and shifting societal priorities.

- **Behavioral Economics Integration:** Understanding how human behavior and decision-making affect resource use and conservation efforts.
- **Natural Capital Accounting:** Developing comprehensive measures that integrate environmental assets into national accounts.
- **Global Commons Governance:** Addressing transboundary resource management challenges,

such as ocean fisheries and the atmosphere.

- **Technological Innovation:** Evaluating the economic impacts of clean energy technologies and resource-efficient production methods.

These areas highlight the dynamic interplay between economics, ecology, and social systems, underscoring the importance of interdisciplinary approaches.

As the world grapples with pressing environmental issues, environmental and natural resource economics remains a critical field for crafting informed, effective policies that ensure the sustainable use of our planet's invaluable resources.

Environmental And Natural Resource Economics

environmental and natural resource economics: *Environmental and Natural Resource Economics* Thomas H. Tietenberg, 1992 This third edition is designed to be of interest to students of environmental and natural resource economics. New chapters, an expanded emphasis on international concerns, domestic topics, and fresh coverage of older topics are covered in an applications-orientated approach.

environmental and natural resource economics: Environmental and Natural Resource Economics Tom Tietenberg, Lynne Lewis, 2018-03-13 Environmental and Natural Resource Economics is the best-selling text for natural resource economics and environmental economics courses, offering a policy-oriented approach and introducing economic theory and empirical work from the field. Students will leave the course with a global perspective of both environmental and natural resource economics and how they interact. Complemented by a number of case studies showing how underlying economic principles provided the foundation for specific environmental and resource policies, this key text highlights what can be learned from the actual experience. This new, 11th edition includes updated data, a number of new studies and brings a more international focus to the subject. Key features include: Extensive coverage of the major issues including climate change, air and water pollution, sustainable development, and environmental justice. Dedicated chapters on a full range of resources including water, land, forests, fisheries, and recyclables. Introductions to the theory and method of environmental economics including externalities, benefit-cost analysis, valuation methods, and ecosystem goods and services. Boxed 'Examples' and 'Debates' throughout the text which highlight global examples and major talking points. The text is fully supported with end-of-chapter summaries, discussion questions, and self-test exercises in the book and multiple-choice questions, simulations, references, slides, and an instructor's manual on the Companion Website.

environmental and natural resource economics: Environmental and Natural Resources Economics Steven Hackett, Sahan T. M. Dissanayake, 2014-12-18 Extensively revised and updated, this popular text presents an accessible yet rigorous treatment of environmental and natural resources economics, including climate change and the economics of sustainability. Completely revised and updated, the fourth edition now includes new figures and tables, definitions to assist the reader, and updated policy information. New advances in the science, economics and policy approaches to climate change have been integrated into essentially all-new chapters on incentive regulation and global climate change. This innovative textbook integrates economics with science and public policy in a balanced and accessible way that will be appreciated by students from

disciplines ranging from economics and natural resources management to environmental studies and energy policy.

environmental and natural resource economics: *Environmental and Natural Resource Economics* Jonathan M. Harris, Brian Roach, 2017-06-26 Environmental issues are of fundamental importance, and a broad approach to understanding the relationship of the human economy and the natural world is essential. In a rapidly changing policy and scientific context, this new edition of *Environmental and Natural Resource Economics* reflects an updated perspective on modern environmental topics. Now in its fourth edition, this book includes new material on climate change, the cost-competitiveness of renewable energy, global environmental trends, and sustainable economies. The text provides a balanced treatment of both standard environmental economics and ecological economics, based on the belief that these two approaches are complementary. Several chapters focus on the core concepts of environmental economics, including the theory of externalities, the management of public goods, the allocation of resources across time, environmental valuation, and cost-benefit analysis. Material on ecological economics includes such topics as macroeconomic scale, entropy, and green national accounting. Topical chapters focus on: energy; climate change; water resources; international trade; forests; fisheries; and agriculture, with an emphasis on designing effective policies to promote sustainability and a green economy. Harris and Roach's premise is that a pluralistic approach is essential to understand the complex nexus between the economy and the environment. This perspective, combined with its emphasis on real-world policies, is particularly appealing to both instructors and students. This is the ideal text for classes on environmental, natural resource, and ecological economics. The book's companion website is available at:

<http://www.bu.edu/eci/education-materials/textbooks/environmental-and-natural-resource-economics/>

environmental and natural resource economics: *Environmental and Natural Resource Economics* Timothy C. Haab Ph.D., John C. Whitehead, 2014-03-28 Accessible to students and practitioners without an advanced degree in environmental economics, this essential reference work pinpoints the role of the economy in both creating and solving many of the world's most pressing environmental challenges. Given the number and scope of environmental problems we face today, everyone from high school students to policy makers to concerned citizens should understand how the economy works and grasp how meltdowns—both economic and environmental in nature—can be avoided. *Environmental and Natural Resource Economics: An Encyclopedia* offers the critical information needed to comprehend these complex issues. The entries cover topics in a manner parallel to how environmental economics is commonly taught, addressing basic concepts, environmental policy, natural resource economics, market failure, exhaustible and renewable resources, benefit-cost analysis, and applied welfare economics. Additionally, the book includes entries on key concepts of economics, movements, events, organizations, important individuals, and research areas relevant to the study of environmental and natural resource economics. This work stands alone as the only title currently offering such a breadth of coverage and level of detail written specifically for readers without specialized knowledge of environmental economics.

environmental and natural resource economics: Resource Economics John C. Bergstrom, Alan Randall, 2016-06-24 *Resource Economics* engages students and practitioners in natural resource and environmental issues from both local and global standpoints. The fourth edition of this approachable but rigorous text provides a new focus on risk and uncertainty as well as new applications that address the effect of new energy technologies on scarcity and climate change mitigation and adaptation, while preserving and systematically updating the approach and key features that drew many thousands of readers to the first three editions.

environmental and natural resource economics: Natural Resources and the Environment Mark Kanazawa, 2021 *Natural Resources and the Environment: Economics, Law, Politics, and Institutions* provides a new approach to the study of environmental and natural resource economics. It augments current contributions from the fields of public choice, law and

economics, and the burgeoning field of what used to be called the 'New Institutional Economics', to describe, explain, and interpret how these new developments have been applied to better understand the economics of natural resources and the environment. This textbook takes a multi-disciplinary approach, which is essential for understanding complex environmental problems, and examines the issue from not only an economic perspective, but also taking into account law, politics and institutions. In doing so, it provides students with a realistic understanding of how environmental policy is created and presents a comprehensive examination of real-world environmental policy. The book provides a comprehensive coverage of key issues, including renewable energy, climate change, agriculture, water resources, land conservation and fisheries, with each chapter accompanied by learning resources, such as recommended further reading, discussion questions and exercises. This textbook is essential reading for students and scholars seeking to build an interdisciplinary understanding of natural resources and the environment--

environmental and natural resource economics: Natural Resource Economics: The Essentials Tom Tietenberg, Lynne Lewis, 2019-08-01 Natural Resource Economics: The Essentials offers a policy-oriented approach to the increasingly influential field of natural resource economics that is based upon a solid foundation of economic theory and empirical research. Students will not only leave the course with a firm understanding of natural resource economics, but they will also be exposed to a number of case studies showing how underlying economic principles provide the basis for specific natural resource policies. Including current data and research studies, this key text also highlights what insights can be derived from the actual experience. Key features include: Extensive coverage of the major issues including energy, recyclable resources, water policy, land conservation and management, forests, fisheries, other ecosystems, and sustainable development; Introductions to the theory and method of natural resource economics including externalities, experimental and behavioral economics, benefit-cost analysis, and methods for valuing the services provided by the environment; Boxed 'Examples' and 'Debates' throughout the text which highlight global examples and major points for deeper discussions. The text is fully supported with end-of-chapter summaries, discussion questions, and self-test exercises in the book, as well as with multiple-choice questions, simulations, references, slides, and an instructor's manual on the Companion Website. This text is adapted from the best-selling Environmental and Natural Resource Economics, 11th edition, by the same authors.

environmental and natural resource economics: Environmental Economics and Policy Thomas H. Tietenberg, Lynne Lewis, 2009 Suitable for use on a policy-oriented course in environmental economics, accessible to both majors and non-majors, this book begins with a brief introduction to the core theory, and then offers a series of self-contained policy chapters that allow professors great flexibility when planning their course.

environmental and natural resource economics: Teaching Environmental and Natural Resource Economics Bergstrom, John C., Whitehead, John C., 2022-01-13 Teaching Environmental and Natural Resource Economics is a significant contribution to the literature of economics education. Theory and practice, teaching activities and exercises, and pro teaching tips are clearly and expertly presented. This guide will prove invaluable in helping students gain a better understanding of the theory and practice of environmental and natural resource economics.

environmental and natural resource economics: Environmental and Natural Resource Economics Kentaka Aruga, 2022-02-07 This textbook discusses environmental and natural resource economics. It presents foundational knowledge for applying economics to understand environmental economics as well as for managing environmental problems and optimizing the level of natural resource extraction. Environmental and Natural Resource Economics bridges knowledge between the major natural environmental issues and which economic policies could be applied for reducing human impacts on such issues. It is distinctive from other environmental economics textbooks by covering not only basic concepts introduced in environmental economics but also explains economic models developed in resource economics for optimizing the use of non-renewable and renewable resources for sustainability. This textbook will help students understand how to apply economics for

utilizing policies to mitigate environmental issues caused from the output side of economic activities such as emitting pollutants or generating wastes and those derived from the input side such as natural resource extractions.

environmental and natural resource economics: The Economics of the Environment and Natural Resources Quentin Grafton, Wiktor Adamowicz, Diane Dupont, Harry Nelson, Robert J. Hill, Steven Renzetti, 2008-04-15 The Economics of the Environment and Natural Resources covers the essential topics students need to understand environmental and resource problems and their possible solutions. Its unique lecture format provides an in-depth exploration of discrete topics, ideal for upper-level undergraduate, graduate or doctoral study. Each chapter depicts the key theoretical insights, major issues, and real-life problems that motivate the subject. In addition, the chapters feature practical applications and case studies, a list of annotated further reading, and extensive references. Offers broad treatment of issues in Environmental and Resource Economics. Provides in-depth exploration of a wide range of topics with its unique lecture format. Depicts key theoretical insights, major issues, and real-life problems for each subject. Features case studies, annotated further reading, extensive references, and a detailed glossary.

environmental and natural resource economics: Environmental and Natural Resource Economics Timothy C. Haab, John C. Whitehead, 2014-03-28 Accessible to students and practitioners without an advanced degree in environmental economics, this essential reference work pinpoints the role of the economy in both creating and solving many of the world's most pressing environmental challenges. Given the number and scope of environmental problems we face today, everyone from high school students to policy makers to concerned citizens should understand how the economy works and grasp how meltdowns—both economic and environmental in nature—can be avoided. Environmental and Natural Resource Economics: An Encyclopedia offers the critical information needed to comprehend these complex issues. The entries cover topics in a manner parallel to how environmental economics is commonly taught, addressing basic concepts, environmental policy, natural resource economics, market failure, exhaustible and renewable resources, benefit-cost analysis, and applied welfare economics. Additionally, the book includes entries on key concepts of economics, movements, events, organizations, important individuals, and research areas relevant to the study of environmental and natural resource economics. This work stands alone as the only title currently offering such a breadth of coverage and level of detail written specifically for readers without specialized knowledge of environmental economics.

environmental and natural resource economics: Environmental and Natural Resource Economics Jonathan M. Harris, 2002 Environmental problems and their local, national, and global solutions have taken on ever-increasing importance in today's world. Economic analysis of environmental problems is essential, but economic perspectives must be complemented with an understanding of the principles of ecological systems. [This book] offers an introduction to the broad perspectives

environmental and natural resource economics: Policy Instruments for Environmental and Natural Resource Management Thomas Sterner, Jessica Coria, 2013-10-30 Thomas Sterner's book is an attempt to encourage more widespread and careful use of economic policy instruments. The book compares the accumulated experiences of the use of economic policy instruments in the U.S. and Europe, as well as in rich and poor countries in Asia, Africa, and Latin America. Ambitious in scope, it discusses the design of instruments that can be employed in any country in a wide range of contexts, including transportation, industrial pollution, water pricing, waste, fisheries, forests, and agriculture. While deeply rooted in economics, Policy Instruments for Environmental and Natural Resource Management is informed by political, legal, ecological, and psychological research. The new edition enhances what has already been widely hailed as a highly innovative work. The book includes greatly expanded coverage of climate change, covering aspects related to policy design, international equity and discounting, voluntary carbon markets, permit trading in United States, and the Clean Development Mechanism. Focusing ever more on leading ideas in both theory and policy, the new edition brings experimental economics into the main of its discussions. It features expanded

coverage of the monitoring and enforcement of environmental policy, technological change, the choice of policy instruments under imperfect competition, and subjects such as corporate social responsibility, bio-fuels, payments for ecosystem services, and REDD.

environmental and natural resource economics: Environmental & Natural Resource Economics Thomas H. Tietenberg, Lynne Lewis, 2009 This 8th edition offers a wealth of new examples and hot topics, such as genetically modified organisms and the cost effectiveness of new transportation fuels. The international edition also considers environmental problems and policies in Western Europe, China and the developing nations.

environmental and natural resource economics: Environmental & Natural Resource Economics, Global Edition Tom Tietenberg, Lynne Lewis, 2015-01-28 For courses in environmental economics Environmental & Natural Resource Economics is the best-selling text for this course, offering a policy-oriented approach and introducing economic theory in the context of debates and empirical work from the field. Students leave the course with a global perspective of both environmental and natural resource economics. Gain flexibility in your course outlines: The text is organized, so that you can fit individual course outlines. Use relevant material: Students identify with up-to-date information, which gives them a global perspective on key issues. Engage students with self-test exercises, debates and examples: Students are able to prepare for their field and learn from an active learning path, which allows them to grasp concepts before moving through the text.

environmental and natural resource economics: Environmental and Natural Resource Economics Frank A. Ward, 2006 Environmental and natural resources have dramatically influenced consumer decisions, personal lifestyles, corporate planning and public policy over recent years. This text introduces the economic theories and methods of analysis economists use to approach these issues.

environmental and natural resource economics: Guide to the Field of Environmental and Natural Resource Economics Carollyne Hutter,

environmental and natural resource economics: Environmental & Natural Resources Economics Tom Tietenberg, Lynne Lewis, 2011-11-21 This is the eBook of the printed book and may not include any media, website access codes, or print supplements that may come packaged with the bound book. Environmental and Natural Resource Economics takes a policy-oriented approach, introducing economic theory in the context of debates and empirical work from the field. Readers will gain a global perspective of both environmental and natural resource economics.
