

technology is not neutral

****Technology Is Not Neutral: Understanding Its Impact Beyond Tools****

technology is not neutral – this statement challenges a common assumption that technology is merely a set of tools, unbiased and impartial, waiting to be used for good or bad depending on the user. In reality, technology carries embedded values, social implications, and power dynamics that shape how it affects society. Understanding this concept is crucial as we navigate an increasingly digital world, where innovations influence everything from privacy and equality to politics and culture.

Why Technology Is Not Neutral: The Embedded Biases

When we create technology, we embed decisions, assumptions, and values into it. These aspects can reflect the biases of the creators, the cultural context, or the economic interests behind the technology.

The Role of Design and Development Choices

Every app, algorithm, or device is designed with specific goals in mind. For instance, facial recognition software often performs differently across demographic groups because the datasets used to train these systems lack diversity. This shows how technology can unintentionally perpetuate existing inequalities.

Similarly, social media platforms are engineered to maximize engagement, sometimes promoting sensational or divisive content. This design choice is not neutral—it actively shapes user behavior and public discourse.

Economic and Political Influences

Technology development rarely happens in a vacuum. It's influenced by corporate priorities and

political agendas. For example, surveillance technologies may be developed and deployed more aggressively in certain communities, raising ethical concerns about privacy and discrimination.

Corporate interests also guide which technologies receive funding and support, often favoring profitable ventures over those that might prioritize social good. This creates technological landscapes that reflect powerful stakeholders' values rather than neutral progress.

How Technology Shapes Society: Beyond Just Tools

To fully grasp that technology is not neutral, we need to look at its broader impacts on social structures, communication, and power relations.

Amplification of Social Inequalities

Technology can amplify existing social inequalities rather than eliminate them. Access to high-speed internet, advanced healthcare technologies, or digital education tools is uneven globally and even within countries. This digital divide means that technology can deepen economic and social gaps.

Furthermore, algorithmic decision-making in areas like hiring, lending, and law enforcement can reinforce systemic biases if not carefully monitored and corrected.

Changing Human Behavior and Interaction

The design of communication technologies shapes how we interact. Consider how smartphones and social media have transformed relationships, attention spans, and mental health. These platforms encourage certain types of interaction, such as instant gratification and constant connectivity, which profoundly affect human behavior and societal norms.

The Power Dynamics Embedded in Technology

Technological tools often redistribute power. For example, data collection technologies give corporations and governments unprecedented insight into individuals' lives, raising questions about surveillance and control. This shift affects the balance of power in society and challenges traditional notions of privacy and freedom.

Recognizing Bias and Ethics in Technology

Understanding that technology is not neutral calls for greater awareness and ethical responsibility in how we develop and use it.

The Importance of Inclusive Design

One way to address embedded biases is through inclusive design processes that involve diverse voices. Developers, policymakers, and users must collaborate to ensure technology serves a broad range of needs and perspectives.

Ethical AI and Algorithmic Accountability

Artificial intelligence and machine learning systems require special scrutiny. Transparency about how algorithms work and accountability for their outcomes are vital to prevent discrimination and misuse.

Organizations and governments are increasingly adopting ethical frameworks and regulations to guide technology development, but these efforts need continuous refinement and enforcement.

Practical Tips for Navigating a World Where Technology Is Not Neutral

As users and citizens, we can take steps to critically engage with technology and advocate for more equitable outcomes.

- **Stay Informed:** Educate yourself about how technologies work and their potential biases.
- **Demand Transparency:** Support companies and platforms that disclose their data practices and algorithmic processes.
- **Advocate for Regulation:** Encourage policymakers to implement laws that protect privacy and promote fairness.
- **Support Inclusive Innovation:** Back initiatives that focus on underserved communities and ethical technology development.
- **Be Mindful of Usage:** Reflect on your own technology use and its impact on your life and relationships.

The Ongoing Conversation Around Technology and Society

The idea that technology is not neutral invites ongoing dialogue between technologists, ethicists, policymakers, and the public. As new innovations emerge, such as AI, blockchain, and biotechnology, these conversations become even more critical.

By recognizing the non-neutrality of technology, we open the door to more thoughtful, inclusive, and responsible innovation. This awareness helps us challenge assumptions, address inequalities, and harness technology's power in ways that truly benefit society.

In the end, technology is not just about gadgets or code; it's about the values and choices embedded within them. Understanding this transforms the way we think about progress and encourages us to shape a future where technology serves everyone fairly.

Frequently Asked Questions

What does the phrase 'technology is not neutral' mean?

The phrase means that technology inherently reflects the values, biases, and intentions of its creators

and users, rather than being an impartial tool.

How can technology reflect societal biases?

Technology can reflect societal biases through the data it uses, the design choices made by developers, and the purposes it serves, which may reinforce existing inequalities or prejudices.

Why is it important to recognize that technology is not neutral?

Recognizing that technology is not neutral helps us critically evaluate its impact, address ethical concerns, and ensure that it promotes fairness and inclusivity rather than perpetuating harm.

Can artificial intelligence systems be truly unbiased?

No, AI systems often inherit biases present in their training data or design, making it challenging to create completely unbiased AI without ongoing scrutiny and correction.

How do design choices influence the neutrality of technology?

Design choices influence neutrality by determining how technology functions, who it serves, and what values are prioritized, thereby shaping its social and ethical implications.

What role do engineers and developers play in the neutrality of technology?

Engineers and developers play a crucial role as their decisions, perspectives, and ethical considerations directly affect how technology operates and whom it benefits or disadvantages.

How can technology perpetuate social inequalities?

Technology can perpetuate social inequalities by embedding existing power structures and biases into algorithms, limiting access for marginalized groups, or designing features that favor certain demographics.

Are there examples of technology being intentionally non-neutral?

Yes, examples include surveillance technologies designed for control, algorithms that target specific populations, and platforms that prioritize certain content for political or commercial gain.

What steps can be taken to mitigate the non-neutrality of technology?

Steps include promoting diversity in tech development teams, implementing ethical guidelines, conducting bias audits, and involving affected communities in the design process.

How does the non-neutrality of technology impact privacy and security?

Non-neutral technology can compromise privacy and security by embedding biases in data collection, enabling surveillance, or prioritizing profit over user protection, thus affecting different groups unevenly.

Technology Is Not Neutral: Examining the Biases Embedded in Innovation

technology is not neutral, a concept that disrupts the common perception of technological tools and systems as objective or impartial. As digital transformation accelerates across industries and societies, it becomes increasingly critical to understand how technology reflects and reinforces human values, power structures, and cultural biases. Far from being mere instruments, technological artifacts and platforms carry the imprints of their creators, the contexts of their development, and the purposes they serve. This investigation delves into why technology cannot be divorced from social, political, and ethical considerations, exploring various dimensions where neutrality is challenged.

Understanding the Non-Neutrality of Technology

The idea that technology is inherently neutral suggests that tools and systems operate independently of human influence or societal context. However, this view overlooks the fact that technology is designed, implemented, and utilized by people who hold specific worldviews, interests, and biases. From algorithms that shape social media feeds to facial recognition software with documented racial disparities, the neutrality of technology is continually contested.

Technology is not neutral because it embodies choices made at every stage—from conceptualization and design to deployment and regulation. These choices determine who benefits from technology, who is excluded, and how power dynamics are maintained or challenged. For instance, the development of artificial intelligence (AI) systems often involves training on data sets that may be incomplete or skewed, resulting in discriminatory outcomes that affect marginalized communities disproportionately.

Algorithmic Bias and Its Societal Impact

One of the most visible examples of technology's non-neutrality is algorithmic bias. Algorithms, often perceived as objective decision-makers, can perpetuate and even amplify existing inequalities. Studies have shown that facial recognition technologies have higher error rates for people of color and women. A 2019 report by the National Institute of Standards and Technology (NIST) found that many commercial facial recognition algorithms misidentified African American and Asian faces at rates much higher than Caucasian faces.

Similarly, predictive policing tools designed to forecast criminal activity have been criticized for reinforcing systemic biases. If the input data is rooted in historically biased law enforcement practices, the technology risks disproportionately targeting minority neighborhoods, thus perpetuating cycles of discrimination.

Design Choices Reflecting Cultural and Political Values

Beyond algorithms, the design and functionality of technology often reflect cultural assumptions and political priorities. For example, user interfaces and voice recognition systems typically cater to dominant languages and accents, marginalizing speakers of less common dialects. This exclusion can limit access and usability for large segments of the population.

Moreover, social media platforms are engineered to maximize user engagement, often prioritizing sensational or emotionally charged content. This design choice, motivated by commercial incentives, has significant implications for public discourse and democracy, influencing how information is consumed and shared globally.

The Role of Corporate and Government Interests

Technology development rarely occurs in a vacuum; it is subject to the influence of corporate agendas and governmental policies. Companies investing in emerging technologies often prioritize profit, scalability, and market dominance over ethical considerations. This focus can lead to trade-offs where user privacy, data security, and social welfare are compromised.

Governments, on the other hand, may use technology as a tool for surveillance and control, raising concerns about civil liberties. The deployment of mass surveillance systems and censorship technologies in various countries illustrates how technology can serve authoritarian ends.

Economic Disparities and Access to Technology

The distribution of technology also underscores its non-neutral character. Economic inequalities affect who can access and benefit from technological innovations. The digital divide remains a critical issue, with underserved communities facing barriers such as lack of infrastructure, affordability challenges,

and limited digital literacy.

These disparities exacerbate existing social inequities, as access to technology increasingly influences educational opportunities, employment prospects, and civic participation. In this sense, technology does not operate as a level playing field but rather as a factor that can deepen divides.

Environmental Implications and Ethical Considerations

The environmental footprint of technology development and usage further illustrates its embedded values and consequences. Manufacturing electronic devices involves resource extraction, energy consumption, and waste generation, often impacting vulnerable ecosystems and communities.

Ethical considerations related to sustainability, responsible sourcing, and lifecycle management are increasingly part of the conversation about technology's broader impact. Decisions around these factors reflect priorities that extend beyond technical efficiency or innovation alone.

Challenging the Myth of Neutral Technology

Recognizing that technology is not neutral compels stakeholders—from developers and policymakers to users—to critically evaluate the social, cultural, and ethical dimensions of technological systems. This awareness encourages inclusive design practices, transparent algorithmic auditing, and regulatory frameworks that prioritize equity and justice.

- **Inclusive Design:** Engaging diverse populations in the development process to ensure technologies accommodate different needs and perspectives.
- **Algorithmic Transparency:** Implementing mechanisms to scrutinize and mitigate biases within automated decision-making systems.

- **Ethical Governance:** Establishing policies that balance innovation with human rights, privacy, and environmental stewardship.
- **Digital Literacy:** Promoting education to empower users to understand and critically engage with technology.

By moving beyond the simplistic notion of neutral technology, society can better address the challenges and harness the potentials of digital transformation in a way that is just and inclusive.

The ongoing dialogue about the role of technology in shaping social realities underlines a fundamental truth: technology is a human creation, embedded with values and biases that influence its impact. Understanding this nuanced relationship is essential to fostering innovations that serve the collective good rather than entrenching existing inequalities.

Technology Is Not Neutral

technology is not neutral: *Technology Is Not Neutral* Stephanie Hare, 2022-02-22 It seems that just about every new technology that we bring to bear on improving our lives brings with it some downside, side effect or unintended consequence. These issues can pose very real and growing ethical problems for all of us. For example, automated facial recognition can make life easier and safer for us - but it also poses huge issues with regard to privacy, ownership of data and even identity theft. How do we understand and frame these debates, and work out strategies at personal and governmental levels? *Technology Is Not Neutral: A Short Guide to Technology Ethics* addresses one of today's most pressing problems: how to create and use tools and technologies to maximize benefits and minimize harms? Drawing on the author's experience as a technologist, political risk analyst and historian, the book offers a practical and cross-disciplinary approach that will inspire anyone creating, investing in or regulating technology, and it will empower all readers to better hold technology to account.

technology is not neutral: Technology and Values Craig Hanks, 2009-05-04 This anthology features essays and book excerpts on technology and values written by preeminent figures in the field from the early 20th century to the present. It offers an in-depth range of readings on important applied issues in technology as well. Useful in addressing questions on philosophy, sociology, and theory of technology Includes wide-ranging coverage on metaphysics, ethics, and politics, as well as issues relating to gender, biotechnology, everyday artifacts, and architecture A good supplemental text for courses on moral or political problems in which contemporary technology is a unit of focus An accessible and thought-provoking book for beginning and advanced undergraduates; yet also a helpful resource for graduate students and academics

technology is not neutral: The Technological System Jacques Ellul, 2018-06-11 Some 20 years after writing *The Technological Society*, Jacques Ellul realized how the totalistic dimensions of our modern technological milieu required an additional treatment of the topic. Writing amidst the rise of books in the 1970s on pollution, over-population, and environmental degradation, Ellul found it necessary, once again, to write about the global presence of technology and its far-reaching effects. *The Technological System* represents a new stage in Ellul's research. Previously he studied technological society as such; in this book he approaches the topic from a systems perspective wherein he identifies the characteristics of technological phenomena and technological progress in light of system theory. This leads to an entirely new approach to what constitutes the most important event of our society which has decisive bearing on the future of our world. Ellul's analysis touches on all aspects of modern life, not just those of a scientific or technological order. In the end, readers are compelled to formulate their own opinions and make their own decisions regarding the way a technique-based value system affects every level of human life.

technology is not neutral: *SPIN*, 1994-01 From the concert stage to the dressing room, from the recording studio to the digital realm, *SPIN* surveys the modern musical landscape and the culture around it with authoritative reporting, provocative interviews, and a discerning critical ear. With dynamic photography, bold graphic design, and informed irreverence, the pages of *SPIN* pulsate with the energy of today's most innovative sounds. Whether covering what's new or what's next, *SPIN* is your monthly VIP pass to all that rocks.

technology is not neutral: *Global Technology and Legal Theory* Guilherme Cintra Guimarães, 2019-06-05 The rise and spread of the Internet has accelerated the global flows of money, technology and information that are increasingly perceived as a challenge to the traditional regulatory powers of nation states and the effectiveness of their constitutions. The acceleration of these flows poses new legal and political problems to their regulation and control, as shown by recent conflicts between Google and the European Union (EU). This book investigates the transnational constitutional dimension of recent conflicts between Google and the EU in the areas of competition, taxation and human rights. More than a simple case study, it explores how the new conflicts originating from the worldwide expansion of the Internet economy are being dealt with by the institutional mechanisms available at the European level. The analysis of these conflicts exposes the tensions and contradictions between, on the one hand, legal and political systems that are limited by territory, and, on the other hand, the inherently global functioning of the Internet. The EU's promising initiatives to extend the protection of privacy in cyberspace set the stage for a broader dialogue on constitutional problems related to the enforcement of fundamental rights and the legitimate exercise of power that are common to different legal orders of world society. Nevertheless, the different ways of dealing with the competition and fiscal aspects of the conflicts with Google also indicate the same limits that are generally attributed to the very project of European integration, showing that the constitutionalization of the economy tends to outpace the constitutionalization of politics. Providing a detailed account of the unfolding of these conflicts, and their wider consequences to the future of the Internet, this book will appeal to scholars working in EU law, international law and constitutional law, as well as those in the fields of political science and sociology.

technology is not neutral: *Technologies of International Relations* Carolin Kaltöfen, Madeline Carr, Michele Acuto, 2018-11-04 This book examines the role of technology in the core voices for International Relations theory and how this has shaped the contemporary thinking of 'IR' across some of the discipline's major texts. Through an interview format between different generations of IR scholars, the conversations of the book analyse the relationship between technology and concepts like power, security and global order. They explore to what extent ideas about the role and implications of technology help to understand the way IR has been framed and world politics are conceived of today. This innovative text will appeal to scholars in Politics and International Relations as well as STS, Human Geography and Anthropology.

technology is not neutral: *Science, Politics, And The Agricultural Revolution In Asia*

Robert S Anderson, Paul R Brass, Edwin Levy, Barrie Morrison, 2019-05-28 Agriculture in southern Asia has undergone a radical transformation in recent years, one that continues to alter the political economy of the area. Beyond the familiar elements of the green revolution, there has been an increase in resource exploitation for food production, and a rise in the economic and political strength of food producers, as well

technology is not neutral: We, robots Lode Lauwaert, Bartek Chomanski, 2025-01-27 This book takes a philosophical look at traditional technological tools such as hammers and drills as well as the modern: autonomous cars, ChatGPT, smartphones, apps, steam engines, nuclear power plants, computers, and many other systems that surround us. The three main questions tackled are: Is technology neutral? Or is the design often intertwined with a Western or gendered perspective? What are the ethical risks of AI? Is it necessarily biased? Is the climate problem linked to smart technologies? Is technological determinism correct? In other words, is the world controlled by engineers since the digital revolution, or are their inventions merely a product of society? Lode Lauwaert and Bartek Chomanski offer an idiosyncratic perspective on technology and AI. The result is a nuanced and critical view of the key themes of our time. This book appeals broadly to students, researchers as well as non-academic audiences for an introduction to the philosophy of technology and AI. "This book explores key themes that all revolve around the idea that technology is not neutral. This is a message for all of us. Because technology is us." Mark Coeckelbergh, University of Vienna

technology is not neutral: The Smartphone Paradox Alan J. Reid, 2018-08-21 The Smartphone Paradox is a critical examination of our everyday mobile technologies and the effects that they have on our thoughts and behaviors. Alan J. Reid presents a comprehensive view of smartphones: the research behind the uses and gratifications of smartphones, the obstacles they present, the opportunities they afford, and how everyone can achieve a healthy, technological balance. It includes interviews with smartphone users from a variety of backgrounds, and translates scholarly research into a conversational tone, making it easy to understand a synthesis of key findings and conclusions from a heavily-researched domain. All in all, through the lens of smartphone dependency, the book makes the argument for digital mindfulness in a device age that threatens our privacy, sociability, attention, and cognitive abilities.

technology is not neutral: Platforms, Power, and Politics Ulrike Klinger, Daniel Kreiss, Bruce Mutsaers, 2023-10-10 Political communication has fundamentally transformed as digital technologies have become increasingly important in everyday life. Technology platforms have become powerful political instruments for world leaders, campaigns, social movements, journalists, and non-governmental organizations. Moreover, they are essential to how people communicate about politics, encounter and share political information, and take action to pursue their political goals. This is the first textbook to center digital platforms in understanding political communication. With global examples beyond the context of Western democracies, the text reveals how digital technologies such as social media and search engines are increasingly shaping political communication in countries around the world. It shows how the core processes of political communication are being reshaped by platforms, from how elections are contested to how issues make it onto policymaking agendas. Topics covered include public opinion, journalism, strategic communication, political parties, social movements, governance, disinformation, propaganda, populism, race, ethnicity, and democratic backsliding. Full of lively examples and pedagogical features, Platforms, Power, and Politics offers an exciting and innovative new approach to political communication. It is essential reading for students of political communication and an important resource for scholars, journalists, and policymakers.

technology is not neutral: Ethics and Technology Herman T. Tavani, 2011 Offering insights and coverage of the field of cyberethics, this book introduces readers to issues in computer ethics. The author combines his years of experience in the field with coverage of concepts and real-world case studies.

technology is not neutral: Sublime Communication Technologies Rod Giblett, 2008-01-17 This

lively new study is a critical cultural history of communication technologies, from railways and telegraphy to computers and the Internet, in which Rod Giblett argues that these technologies play a pivotal role in the cultural history of modernity and its project of the sublime.

technology is not neutral: Technology Transfer and Innovation for Low-Carbon Development Miria Pigato, Simon Black, Damien Dussaux, Zhimin Mao, Ryan Rafaty, Simon Touboul, 2020-04-09 Technological revolutions have increased the world's wealth unevenly and in ways that have accelerated climate change. This report argues that achieving The Paris Agreement's objectives would require a massive transfer of existing and commercially proven low-carbon technologies (LCT) from high-income to developing countries where the bulk of future emissions is expected to occur. This mass deployment is not only a necessity but also an opportunity: Policies to deploy LCT can help countries achieve economic and other development objectives, like improving human health, in addition to reducing greenhouse gases (GHGs). Additionally, LCT deployment offers an opportunity for countries with sufficient capabilities to benefit from participation in global value chains and produce and export LCTs. Finally, the report calls for a greater international involvement in supporting the poorest countries, which have the least access to LCT and finance and the most underdeveloped physical, technological, and institutional capabilities that are essential to benefit from technology.

technology is not neutral: Extimate Technology Ciano Aydin, 2021-01-21 This book investigates how we should form ourselves in a world saturated with technologies that are profoundly intruding in the very fabric of our selfhood. New and emerging technologies, such as smart technological environments, imaging technologies and smart drugs, are increasingly shaping who and what we are and influencing who we ought to be. How should we adequately understand, evaluate and appreciate this development? Tackling this question requires going beyond the persistent and stubborn inside-outside dualism and recognizing that what we consider our inside self is to a great extent shaped by our outside world. Inspired by various philosophers – especially Nietzsche, Peirce and Lacan – this book shows how the values, goals and ideals that humans encounter in their environments not only shape their identities but also enable them to critically relate to their present state. The author argues against understanding technological self-formation in terms of making ourselves better, stronger and smarter. Rather, we should conceive it in terms of technological sublimation, which redefines the very notion of human enhancement. In this respect the author introduces an alternative, more suitable theory, namely Technological Sublimation Theory (TST). Extimate Technology will be of interest to scholars and advanced students working in philosophy of technology, philosophy of the self, phenomenology, pragmatism, and history of philosophy. The Open Access version of this book, available at <http://www.taylorfrancis.com/books/9781003139409>, has been made available under a Creative Commons Attribution-Non Commercial-No Derivatives 4.0 license.

technology is not neutral: Ethics for People Who Work in Tech Marc Steen, 2022-10-28 This book is for people who work in the tech industry—computer and data scientists, software developers and engineers, designers, and people in business, marketing or management roles. It is also for people who are involved in the procurement and deployment of advanced applications, algorithms, and AI systems, and in policy making. Together, they create the digital products, services, and systems that shape our societies and daily lives. The book's aim is to empower people to take responsibility, to 'upgrade' their skills for ethical reflection, inquiry, and deliberation. It introduces ethics in an accessible manner with practical examples, outlines of different ethical traditions, and practice-oriented methods. Additional online resources are available at: ethicsforpeoplewhoworkintech.com.

technology is not neutral: A Christian Field Guide to Technology for Engineers and Designers Ethan J. Brue, Derek C. Schuurman, Steven H. VanderLeest, 2022-04-19 Technology and its power are both old and new—as is the wisdom needed to envision, design, and use it well. In this field guide for Christians studying and working in technology, case studies, historical examples, and personal stories encourage readers to ask harder questions, aspire to more noble purposes, and live

a life consistent with their faith as they engage with technology.

technology is not neutral: *Research Handbook on Intellectual Property and Artificial Intelligence* Ryan Abbott, 2022-12-13 This incisive Handbook offers novel theoretical and doctrinal insights alongside practical guidance on some of the most challenging issues in the field of artificial intelligence and intellectual property. Featuring all original contributions from a diverse group of international thought leaders, including top academics, judges, regulators and eminent practitioners, it offers timely perspectives and research on the relationship of AI to copyright, trademark, design, patent and trade secret law.

technology is not neutral: Where Wisdom May Be Found Edward P. Meadors, 2019-08-29 All Christian colleges and universities hail the integration of faith and learning as a premier mission objective. There is less agreement as to what the integration of faith and learning should look like in pedagogical and cross-disciplinary terms. This volume proposes that faith and learning are interrelated from the start. Discovery of truth within the academic disciplines cultivates discipline-specific wisdom that both accords with all reality and complements the whole counsel of God. Where Wisdom May Be Found brings together a faculty of twenty-seven accomplished voices from across curricula to celebrate each field's capacity for revealing wisdom from all corners of God's creative design. In synthesis, these voices declare the depth and richness of the wisdom and knowledge of God for the educational advancement and holistic equipping of the corporate people of God.

technology is not neutral: Encountering Artificial Intelligence Matthew J. Gaudet, Noreen Herzfeld, Paul Scherz, Jordan J. Wales, 2024-03-15 What does it mean to consider the world of AI through a Christian lens? Rapid developments in AI continue to reshape society, raising new ethical questions and challenging our understanding of the human person. Encountering Artificial Intelligence draws on Pope Francis's discussion of a culture of encounter and broader themes in Catholic social thought in order to examine how current AI applications affect human relationships in various social spheres and offers concrete recommendations for better implementation. The document also explores questions regarding personhood, consciousness, and the kinds of relationships humans might have with even the most advanced AI. Through these discussions, the document investigates the theoretical and practical challenges to interpersonal encounter raised by the age of AI.

technology is not neutral: The Political Philosophy of AI Mark Coeckelbergh, 2022-01-31 Political issues people care about such as racism, climate change, and democracy take on new urgency and meaning in the light of technological developments such as AI. How can we talk about the politics of AI while moving beyond mere warnings and easy accusations? This is the first accessible introduction to the political challenges related to AI. Using political philosophy as a unique lens through which to explore key debates in the area, the book shows how various political issues are already impacted by emerging AI technologies: from justice and discrimination to democracy and surveillance. Revealing the inherently political nature of technology, it offers a rich conceptual toolbox that can guide efforts to deal with the challenges raised by what turns out to be not only artificial intelligence but also artificial power. This timely and original book will appeal to students and scholars in philosophy of technology and political philosophy, as well as tech developers, innovation leaders, policy makers, and anyone interested in the impact of technology on society.
