Oracle Golden Gate Configuration Step by Step: A Comprehensive Guide

oracle golden gate configuration step by step can seem daunting at first, especially if you're new to data replication or real-time integration. However, breaking down the process into manageable steps makes it much easier to grasp and implement effectively. Oracle GoldenGate is a powerful solution for real-time data replication, high availability, and disaster recovery. Whether you're setting it up for a one-way replication or a bi-directional data sync, understanding the configuration intricacies is essential. In this guide, we'll walk through the Oracle Golden Gate configuration step by step, demystifying the setup and offering practical insights along the way.

Understanding Oracle GoldenGate and Its Role

Before diving into the Oracle Golden Gate configuration step by step, it's beneficial to understand what this tool does and why it's widely used. Oracle GoldenGate facilitates real-time data replication across heterogeneous systems with minimal latency. It captures and delivers transactional data changes from one database to another, ensuring data consistency and availability.

This technology is crucial for scenarios like disaster recovery, load balancing, data warehousing, and zero-downtime migrations. The configuration process involves several components, including Extract, Trail Files, and Replicat, which work together to capture, transport, and apply data changes.

Preparing Your Environment for Oracle Golden Gate Configuration

Before you begin the Oracle Golden Gate configuration step by step, certain prerequisites must be in place to ensure a smooth setup.

System Requirements and Compatibility

Oracle GoldenGate supports various database versions and platforms. Confirm that your source and target databases are compatible with the GoldenGate version you plan to install. Additionally, ensure that the operating system and network settings meet the requirements.

Database and User Setup

GoldenGate requires specific privileges to capture and apply data changes. On both the source and target databases:

- Create dedicated GoldenGate users with appropriate permissions.
- Enable supplemental logging on the source database to capture all necessary data changes.
- Ensure the databases are in ARCHIVELOG mode if you're working with Oracle databases, as this is vital for consistent data extraction.

Installing Oracle GoldenGate Software

Download the correct GoldenGate software package for your platform from Oracle's official site. Install the software on both source and target servers. It's important to install the same version on both ends to avoid compatibility issues.

Oracle Golden Gate Configuration Step by Step

Now that your environment is ready, let's walk through the core steps involved in configuring Oracle GoldenGate.

Step 1: Configure Manager Parameter File

The Manager process is the GoldenGate controller that manages all other processes. On both source and target servers:

1. Navigate to the GoldenGate installation directory.
2. Create a parameter file named `mgr.prm` inside the `dirprm` directory.
3. Add the following content, specifying the port number:

```
...  
PORT 7809  
...
```

4. Start the Manager process using the command:

```
...
```

```
GGSCI> START MANAGER
```

```
'''
```

Verify that the Manager is running by typing:

```
'''
```

```
GGSCI> INFO MANAGER
```

```
'''
```

Step 2: Create and Configure Extract Process

The Extract process captures committed transactions from the source database.

1. In GGSCI (GoldenGate Software Command Interface), create the Extract process:

```
'''
```

```
GGSCI> ADD EXTRACT ext1, TRANLOG, BEGIN NOW
```

```
'''
```

2. Specify the source database connection using a parameter file `ext1.prm`:

```
'''
```

```
EXTRACT ext1
```

```
USERIDALIAS ggs_user
```

```
EXTTRAIL ./dirdat/aa
```

```
TABLE schema_name.*;
```

```
'''
```

3. Register the Extract process with the database if required by your database type.

4. Start the Extract process:

```
'''
```

```
GGSCI> START EXTRACT ext1
```

```
'''
```

Step 3: Set Up Trail Files

Trail files store the captured data changes and allow asynchronous delivery to the target. The Extract writes to local trail files on the source machine, which the Data Pump process can then read.

Step 4: Configure Data Pump (Optional but Recommended)

A Data Pump process reads the local trail files and sends data to the target system over the network.

1. Add the Data Pump Extract:

```
'''  
GGSCI> ADD EXTRACT pump1, EXTTRAILSOURCE ./dirdat/aa  
'''
```

2. Create the parameter file `pump1.prm`:

```
'''  
EXTRACT pump1  
RMTHOST target_server_ip, MGRPORT 7809  
RMTTRAIL ./dirdat/bb  
TABLE schema_name.*;  
'''
```

3. Start the Data Pump:

```
'''  
GGSCI> START EXTRACT pump1  
'''
```

Step 5: Configure Replicat Process on Target

The Replicat process applies the data changes to the target database.

1. Add the Replicat process:

```
'''  
GGSCI> ADD REPLICAT rep1, EXTTRAIL ./dirdat/bb  
'''
```

2. Create the parameter file `rep1.prm`:

```
'''  
REPLICAT rep1  
ASSUMETARGETDEFS  
USERIDALIAS ggs_user
```

```
MAP schema_name.*, TARGET schema_name.*;  
'''
```

3. Start the Replicat process:

```
'''  
GGSCI> START REPLICAT rep1  
'''
```

Monitoring and Troubleshooting Oracle GoldenGate

Oracle Golden Gate Configuration Step by Step: A Detailed Guide for Seamless Data Replication

oracle golden gate configuration step by step is a critical process for organizations aiming to achieve real-time data integration and replication across heterogeneous databases. As businesses increasingly rely on data-driven decisions, ensuring data consistency, availability, and minimal latency becomes paramount. Oracle GoldenGate (OGG) stands out as a robust, high-performance solution for replicating transactional data between databases with minimal impact on source systems. However, configuring Oracle GoldenGate correctly requires a meticulous approach to guarantee optimal performance and reliability.

This article delves into the intricacies of Oracle GoldenGate configuration step by step, exploring essential components, prerequisites, and best practices. By examining the configuration process in detail, IT professionals and database administrators can better understand how to leverage Oracle GoldenGate for efficient data replication and disaster recovery strategies.

Understanding Oracle GoldenGate and Its Core Components

Before diving into the configuration process, it is essential to understand what Oracle GoldenGate entails and the primary components involved in its architecture. Oracle GoldenGate is a real-time data replication

and integration tool designed to capture, route, transform, and apply transactional data across multiple database platforms.

The core components include:

- **Extract Process:** Captures committed transactions from the source database's redo or transaction logs.
- **Data Pump (optional):** A secondary extract process that moves captured data to the target system.
- **Trail Files:** Intermediate files storing captured data before it is applied on the target.
- **Replicat Process:** Applies the captured transactions to the target database.

These components work in tandem to ensure transactional consistency and near real-time data replication, making Oracle GoldenGate a preferred choice for high-availability environments.

Prerequisites for Oracle GoldenGate Configuration

Setting up Oracle GoldenGate involves several prerequisite checks and system preparations that impact the success of the configuration process. These prerequisites include:

- **Compatible Database Versions:** Oracle GoldenGate supports various Oracle Database versions, but verifying compatibility is crucial to avoid configuration errors.
- **Network Connectivity:** Stable and secure network connections between source and target systems are mandatory to facilitate data transfer.
- **User Privileges:** The database user must have adequate privileges such as `SELECT_CATALOG_ROLE`, `EXECUTE` on `DBMS_LOGMNR`, and access to redo logs.
- **Sufficient Disk Space:** The system should have enough disk space for trail files and process logs.
- **Oracle GoldenGate Software Installation:** The software must be installed on both source and target servers, matching the database architecture (32-bit or 64-bit).

Properly addressing these prerequisites lays a solid foundation for a smooth and error-free Oracle

GoldenGate configuration.

Oracle GoldenGate Configuration Step by Step

The configuration of Oracle GoldenGate can be broken down into a structured sequence of steps. Following this logical flow ensures that each component is correctly set up and integrated.

Step 1: Install Oracle GoldenGate Software

Download the Oracle GoldenGate software compatible with your operating system and database version from the official Oracle website. Install the software on both the source and target servers, ensuring that installation directories are consistent to avoid path-related issues.

Step 2: Prepare the Source Database

Before starting replication, configure the source database for supplemental logging. Supplemental logging is mandatory for capturing the changes required by Oracle GoldenGate.

Execute the following SQL commands:

```
ALTER DATABASE ADD SUPPLEMENTAL LOG DATA;  
ALTER DATABASE ADD SUPPLEMENTAL LOG DATA (PRIMARY KEY) COLUMNS;
```

Additionally, create a database user with the necessary privileges to support extract processes:

```
CREATE USER ogg_user IDENTIFIED BY password;  
GRANT CONNECT, RESOURCE TO ogg_user;  
GRANT SELECT ANY TRANSACTION TO ogg_user;  
GRANT SELECT ON V_$DATABASE TO ogg_user;  
GRANT EXECUTE ON DBMS_LOGMNR TO ogg_user;
```

Step 3: Configure Manager Parameter File

The Manager process controls all Oracle GoldenGate operations. On both source and target servers, create the Manager parameter file (mgr.prm) with essential configurations such as the port number and

checkpoint settings.

Example mgr.prm content:

```
PORT 7809
AUTOSTART ER *
AUTORESTART ER *
CHECKPOINTTABLE ogg_user.checkpoint_table
```

Start the Manager process using the GoldenGate command interface:

```
START MANAGER
```

Step 4: Configure Extract Process on Source

Define the Extract process to capture changes from the source database. Create an extract parameter file (ext.prm) specifying the capture mode and trail file location.

Example extract parameter file:

```
EXTRACT ext1
USERID ogg_user, PASSWORD password
EXTTRAIL ./dirdat/et
TABLE schema_name.*;
```

Register the extract process with Oracle GoldenGate:

```
ADD EXTRACT ext1, TRANLOG, BEGIN NOW
REGISTER EXTRACT ext1 DATABASE
```

Start the extract process:

```
START EXTRACT ext1
```

Step 5: Configure Data Pump (Optional)

A data pump process can be configured as a secondary extract to send data over the network securely and efficiently.

Example data pump parameter file:

```
EXTRACT pump1
PASSTHRU
RMTHOST target_server, MGRPORT 7809
RMTTRAIL ./dirdat/rt
```

Add and start the pump process similarly:

```
ADD EXTRACT pump1, EXTTRAILSOURCE ./dirdat/et
START EXTRACT pump1
```

Step 6: Configure Replicat Process on Target

On the target server, configure the Replicat process to apply data changes. Create the replicat parameter file (rep.prm):

```
REPLICAT rep1
USERID ogg_user, PASSWORD password
ASSUMETARGETDEFS
DISCARDFILE ./dirrpt/rep1.dsc, APPEND, MEGABYTES 50
MAP schema_name.*, TARGET schema_name.*;
```

Add and start the replicat process:

```
ADD REPLICAT rep1, EXTTRAIL ./dirdat/rt
START REPLICAT rep1
```

Step 7: Monitor and Troubleshoot

Monitoring Oracle GoldenGate processes is vital to ensure uninterrupted replication. Use commands like:

```
INFO EXTRACT ext1  
INFO REPLICAT rep1
```

Check error logs located in the GoldenGate installation directories for any anomalies. Regularly verify trail file sizes and process lag to maintain performance.

Key Considerations and Best Practices

Implementing Oracle GoldenGate involves more than just configuration; it requires strategic planning and adherence to best practices to maximize efficiency.

- **Consistent Trail File Management:** Ensure that trail files are secured and cleaned up regularly to prevent disk space exhaustion.
- **Network Optimization:** Optimize network bandwidth and latency between source and target to reduce lag.
- **Use of Integrated Capture:** For Oracle databases, integrated capture mode provides better performance and reduces resource consumption.
- **Security Measures:** Encrypt data in transit and restrict access to GoldenGate directories and processes.
- **Regular Backups:** Backup GoldenGate configuration files and trail data to avoid data loss during failures.

Comparatively, Oracle GoldenGate offers more granular control and lower latency replication than traditional Oracle Data Guard, especially in heterogeneous environments where source and target databases differ.

Final Thoughts on Oracle GoldenGate Configuration Step by Step

Mastering the oracle golden gate configuration step by step unlocks the potential for seamless, real-time data replication that is essential in today's dynamic data landscapes. While the configuration process might appear intricate, a systematic approach to installation, parameter file setup, and process management mitigates risks and enhances operational efficiency.

As enterprises continue to demand high availability and data integrity across distributed systems, Oracle GoldenGate's flexible architecture and advanced features position it as a fundamental tool in the data replication toolbox. Investing time in understanding each step and incorporating best practices ensures that Oracle GoldenGate configurations are resilient, scalable, and aligned with organizational goals.

oracle golden gate configuration step by step: *Migration einer Oracle Datenbank unter bestimmten Kriterien mit Data Guard GoldenGate* Daniel Gawenda, 2016-01-28 Bachelorarbeit aus dem Jahr 2015 im Fachbereich BWL - Informationswissenschaften, Informationsmanagement, Note: 1,3, Fachhochschule der Deutschen Telekom in Leipzig, Sprache: Deutsch, Abstract: Die Bachelorarbeit Standortübergreifende Migration einer relationalen Oracle Datenbank zu einem neuen System inklusive Schemaintegration und minimaler Auszeit. beschäftigt sich mit der Migration einer 17 TB großen Oracle Datenbank. Dafür wurde als Praxisteil ein Testsystem aufgesetzt, um diese Migration unter den gegebenen Kriterien durchzuspielen. Für die Migration wurde RMAN, Data Guard und GoldenGate verwendet. Alle abgesetzten Befehle sind im Anhang enthalten und die Arbeit enthält eine ausführliche Beschreibung und Gegenüberstellung von Replikationstechniken. Das Ziel dieser Arbeit ist die erfolgreiche Migration der Datenbank mit allen geforderten Kriterien. Da die Migration der CRM-T-Umgebung erst Ende 2015 oder Anfang 2016 stattfinden wird, soll diese Arbeit zusätzlich eine Vorlage für diese Migration bieten. Außerdem dient sie als Beweis, dass die geplante Migration in entsprechender Ausführung funktioniert. Daher werden alle Befehle und Konfigurationsparameter protokolliert und im Anhang beigefügt. Bis jetzt hatte das Unternehmen nicht die Möglichkeit die geplanten Sicherheitsvorkehrungen in der Praxis zu testen, da noch keine Verbindung zwischen den beiden Standorten besteht. Da die gleichen Konfigurationen in der Testumgebung verwendet werden, wird das Netzwerk zwischen den Datenbanken mit einer bestimmten Software überwacht. Dadurch wird erkannt, ob die Verschlüsselung funktioniert und das Unternehmen T-Systems kann anhand der Bachelorarbeit die Verschlüsselung auf der CRM-T-Umgebung implementieren.
