The two case studies that conclude the book—one on criminal investigation of expert systems and the other on navigational planning of robots—focus mostly on the implementation of intelligent systems through the use of the techniques discussed in the book.

artificial intelligence for humans volume 1 fundamental algorithms: The Challenges of Artificial Intelligence for Law in Europe Marton Varju, Kitti Mezei, 2025-06-11 As artificial intelligence continues to transform our world, Europe stands at the forefront of ensuring this revolutionary technology serves humanity's best interests. This essential volume brings together experts on law, regulation, human rights, ethics, and policy to provide the first comprehensive analysis of Europe's pioneering approach to AI regulation. From the landmark AI Act to data protection and data governance frameworks, this meticulously curated collection offers unprecedented insights into (1) the delicate balance between the public and private benefits of AI, and the public and private risks it poses; (2) the regulatory policy and regulatory strategy influencing European law-making; (3) the role of ethics and human rights in regulating AI in Europe; (4) the real-world implications of evolving European AI regulation; and (5) future challenges and opportunities in the rapidly evolving AI landscape. Distinguished contributors from the fields of legal scholarship, policymaking, and legal practice provide unique perspectives on the legal and policy foundations of the AI Act, the Council of Europe Framework Convention, and other international documents; the regulatory design and requirements of the AI Act; the challenges of using AI in adjacent legal and regulatory areas; ethical issues surrounding the technology and their impact on its proliferation in the private and public sectors; and compliance-related challenges and practical solutions in key sectors. This authoritative work offers invaluable guidance to help legal professionals, researchers, policymakers, and technology executives navigate the complexities of AI regulation at the intersections of innovation, the public and private good, and social control. The volume combines theoretical depth and contextual analysis with practical applicability, making it an indispensable resource for anyone involved in shaping or adapting to Europe's AI regulatory landscape. The book is also essential reading for AI researchers and developers, technology consultants and industry analysts, policymakers and regulators, legal practitioners and compliance officers.

artificial intelligence for humans volume 1 fundamental algorithms: Unification of Artificial Intelligence and Psychology Petros A. M. Gelepithis, 2024-10-21 This book —the first of a two-volume monograph— seeks to unify the hitherto perceived-as-disparate foundations of psychology and artificial intelligence. It does this by replacing their constitutive notions with a novel common one: noémon system. The ensued Theory of Noémon Systems is developed in terms of an interdisciplinary, language- based, axiomatic approach. The first volume details the development of the foundations of the theory and expounds ramifications for cognitive science and AI including novel solutions to the AGI debate and Darwin's mental gap issue, while offering the first complete definition of AI. The book concurrently explores the similarities and differences between humans and AI/robot systems with respect to the evolution-dependent phenomena of representation, thinking, understanding and communication. The book is an extensive one; because of its extensiveness and broad ramifications, this book will appeal to scientists working on the interfaces of psychology, AI, philosophy of mind, neuroscience, and the humanities. The complicated and extensive unification of the fields of Artificial Intelligence and psychology is continued in the second volume that breaks further new ground for both disciplines, with thought-provoking and compelling implications for both.
